- Three.js
- Blender

Projects

Guitar Display

This is a React Three Fiber app. The app displays my 3D glb model created in Blender which uses ScrollControls and GSAP timeline to animate it. It also includes a subpage route where you can interact with the same model.You can move around with OrbitControls, click on different parts with camera foucus, display mesh name on hover near the cursor and change mesh material color.

Portfolio

This is a React website built with ViteJS. It showcases technologies i have been using with links to my socials, Github respositories and online demos. This website also contains modals with more information about the projects with screenshots and form that uses emailjs to send messages to my email address.

Grafika

Vanilla JavaScript website which contains buttons appearing on hover or click on touch-screen devices. Two buttons open up text container in the same place which you can close. The other buttons open up the modals with filtering of images and ability to click on them in order to zoom and swipe them with the PhotoSwipe.
